GPT review handoff

What the second model checks, and the exact prompt it receives

Why a second model reviews this

Claude wrote the design and the numbers. A model from another company is less likely to repeat the same mistakes. GPT checks the facts against current sources and recomputes the math. It writes its findings to a file and leaves the plan untouched. Et decides what to change.

What GPT checks

#	Area	Question
1	Prices	Max 20x, Team premium and Apple base prices still match the vendor pages.
2	Terms	Personal Max for company work, subscription logins for unattended loops, and use of included API credit.
3	T3 Code	Six macOS users at once, two Claude provider entries per user, T3 Connect cost and limits.
4	Loop design	The keep rule, the noise margin, and protection against gaming the metric.
5	Arithmetic	Every total in the financials, recomputed from build.py.
6	First week	Anything likely to break in the first week of use.

Open questions Claude could not settle

1. Whether T3 Code can serve six macOS users on one Mac at the same time through T3 Connect.
2. Whether Anthropic's terms allow subscription logins to run scheduled loops with nobody watching.
3. Whether the API credit included with Max 20x may pay for company work.
4. How much more usage a Team standard seat gets than Pro. This sets the exact premium-seat capacity.
5. The configured price of a Mac Studio M5 Max with 64 GB and 2 TB.

Pass criteria for the plan

- No wrong price or total.
- No account use that breaks a vendor's terms.
- Every open question answered with a source, or listed as needing a vendor reply.

What changed after round 1

GPT-6.1-Sol reviewed the plan on October 31, 2026. Its full findings are in `04-gpt-review.pdf`. It confirmed every total. These changes went into reports 1 and 2.

Finding	Change
The $200 personal tier is now called Ultra	Renamed everywhere. Price unchanged
Team premium seats include $100 of API credit each, pooled, capped at $500 per org	Added the $500 company pool and the claim rules
Tailscale's free plan is non-commercial	Budgeted Standard at $576 a year
"Unattended means API only" is a policy, not a vendor rule	Reworded as company policy. Left as an open question for Anthropic
Usage ratios are marketing figures	Labeled as nominal. The pilot measures finished tasks per seat
Six T3 users on one Mac is unproven	New rollout step tests it on the MacBook before buying
Variants could game the scorer	Sandboxed scoring, locked test files, and a check that every test ran
Three baseline runs are too few, and the held-out set gets reused	Paired re-runs across seeds. Tuning, check and audit sets kept separate
No safe merge order	Single-writer ledger. Winners rebase, re-score and merge one at a time
Headline budget left out the API reserve and Tailscale	All-in year 1 is now $48,874
The Team minimum is two seats, not five	The pilot starts with two monthly seats

Added after round 1

Et widened the plan from 12 Claude accounts to 24 accounts: each person also gets ChatGPT Pro and a ChatGPT Business premium seat. GPT has not reviewed this change. The ChatGPT prices come from pricing guides and need confirming on chatgpt.com/pricing.

Et also moved the hub from a Mac Studio to a Linux tower running Ubuntu Server. T3 Code's Linux service keeps each person's session running after logout, which removes the risk GPT ranked R2. GPT has not reviewed this change either.

Still open after round 1

- The ChatGPT Pro and Business premium prices. Confirm them on OpenAI's site.
- Whether OpenAI's terms allow personal ChatGPT Pro accounts on company code and subscription logins in scheduled loops.
- May a personal Ultra account do this company's work under the US consumer terms? Ask Anthropic in writing.
- May subscription logins drive scheduled loops through T3? Ask Anthropic in writing.
- Current prices for the Linux tower's CPU and memory. Check them the week you buy.

The prompt sent to GPT

```
You are reviewing an infrastructure plan written by Claude. Your job is to find what is wrong,
missing or risky. Do not rewrite the plan.

Files in /Users/et/ai-studio-plan/:
- 01-infrastructure-design.pdf and .html
- 02-financials.pdf and .html, financials.csv
- src/build.py, the single source of every number

The plan: six people, each with a personal Claude Max 20x account and a Claude Team premium seat
(twelve accounts). One studio hub (Et's MacBook Pro now, a Mac Studio M5 Max later) runs T3 Code
for each person in a separate macOS user, plus a shared eval runner, git worktrees and a results
ledger. The goal is hill-climbing loops: generate K code variants in parallel, score them with the
same tests, keep the winner only if it beats the best by a noise margin, have GPT review the
winner, merge, repeat.

Check these, using current primary sources (vendor pricing pages, terms of service, official docs).
Cite the URL for every claim you make.
1. Prices: Max 20x $200/mo with $200/mo API credit; Team premium $125 monthly or $100 annual per
seat; Team minimum seats. Apple base prices for Mac Studio M5 Max ($2,499), Mac mini M5 Pro
($1,699), Mac mini M6 ($899).
2. Terms: may personal Max accounts do company work? May subscription logins drive scheduled or
unattended loops, or must those use API keys? May one person's included API credit pay for company
work?
3. T3 Code: can one Mac run six macOS users with T3 Code reachable through T3 Connect at the same
time? Does T3 support two Claude provider entries per user, one per account? What does T3 Connect
cost?
4. Hill-climb design: is the keep rule sound? Is the noise margin method enough? What stops a
variant from gaming the metric?
5. Arithmetic: recompute every total in the financials from build.py.
6. Anything that would make this setup fail in its first week.

Do not edit the plan files. Write your findings to /Users/et/ai-studio-plan/gpt-review.md with
three sections: Errors (wrong facts or math, with the fix), Risks (ranked, with what to do),
Confirmed (what you checked and found correct). Mark each finding as verified, with a source, or as
a judgment call.
```

Prepared October 31, 2026 for Et. Prices tagged "verified" were read from the vendor's page on that date. Prices tagged "check" come from recent pricing guides because the vendor page blocked automated reads. Prices tagged "estimate" are placeholders that need a quote before purchase.
